INTERVIEW-PREP PACKET 5 OF 5 · PER-INTERVIEWER · BUSINESS-PROCESS LENS

Amazon NACF Supply Chain loop — Packet 5: Venkata Josyula

Amazon — Senior Supply Chain Manager, NACF Supply Chain (L6)

Venkata Josyula

Principal Product Manager, FBA — treat as BAR RAISER

Thursday, October 30, 2026 · 12:00 pm PDT · 55-minute video interview

> **Strategy in one line.** Treat as the Bar Raiser: independent of the hiring team, holding a veto, probing LP depth to the fifth why and consistency across every story and every interviewer's notes. Four stories, one per employer — S16 (Flexport: four systems → one pipeline; the security-review miss owned upward), S15 (Sephora: the gate handed to the skeptic), S10 (Elementum: Austria — the data said measurement), S14 (Manhattan: the $2.5M discrepancy, transparency over a quiet fix). Answer the LP asked, then stop; keep facts identical when the LP switches; every dollar with its basis label.

LP focus — my guess, not confirmed: Earn Trust · Ownership or Hire & Develop the Best · Are Right, A Lot or Broad Responsibility. Amazon does not disclose the assignment; the guesses are reasoned from the interviewer's title and the JD in "Read me first" and should be held loosely. No interviewer biography is asserted anywhere in this packet — only title-based inference, labeled as such.

Bar-raiser lens: LP depth + cross-story data consistency. This packet carries an LP-coverage grid (which of the four stories can serve which LP) and a consistency-rules box (the numbers a bar raiser cross-checks) — read both before the call.

Canon: amazon/amazon-l6-scm-master-packet.html (§1.2 roster, §4.1 ledger). Every number below is that packet's value; every dollar carries its basis label (record · user anchor · modeled · priced).

Read me first

The interviewer's lens (inference from title + JD — not a biography)

Inference from the title and the slot. A Principal Product Manager from FBA — outside the hiring team, the last interview of the loop — is the profile of a Bar Raiser: an interviewer trained to be independent of the hiring manager, to hold the bar at "better than half the people at this level," and to hold a veto. Bar raisers are less interested in the supply-chain content than in *how the candidate thinks and whether the stories are consistent*: they drill one story to the fifth "why," they switch LPs mid-story to see whether the candidate re-tells the same facts honestly from a different angle, and they compare numbers across stories and across interviewers' notes. A PM from FBA additionally brings a seller/customer lens — who was the customer, what did they experience, what did you give up for them.

What that means for the answers. Four stories, one per employer, so that the bar raiser sees range and the same voice across fifteen years: S16 (Flexport — four systems into one pipeline, the security-review miss owned upward the same day), S15 (Sephora — a 20-person team moved to a four-week cadence by handing the gate to the skeptic), S10 (Elementum — Austria: "the noise said carriers; the data said measurement," one site's fix rolled to 25), S14 (Manhattan — the $2.5M discrepancy, transparency over a quiet fix). Each is told business-first; each ends on a number with a basis label; two of them are failure or near-failure stories, because bar raisers probe for lessons. The LP-coverage grid and the consistency-rules box below exist because this interviewer will test exactly those two things.

Three guessed LP focus areas, with rationale

> **Labeled guess.** Amazon assigns 2–3 Leadership Principles per interviewer and does not disclose them. These three are inferred from the title and the JD; if the first question lands on a different LP, the twist maps under each story carry the pivot.

GUESSED LP	WHY THIS INTERVIEWER WOULD CARRY IT	STORY TO OPEN · BACKUP
Earn Trust (the flagship)	Bar raisers almost always carry a trust/integrity LP, and they want the expensive version — the customer told first, the cost priced onto the candidate. S14 is the master map's Earn Trust primary; S16's same-day upward ownership of the miss is the recent echo.	S14 (open) · S16 (owned the miss upward)
Ownership / Hire & Develop the Best (one of the two)	Bar raisers take LPs the HM did not assign; Ownership (S16 — writing a bus-factor-1 system out of my own hands; owning the scoping miss) and Hire & Develop (S15 — the QA lead who now owns the gate) are both primaries in the master map and both unassigned elsewhere in this loop.	S16 (Ownership) · S15 (Hire & Develop / Earth's Best Employer)
Are Right, A Lot / Success & Scale Bring Broad Responsibility (one of the two)	Judgment under a confident room, and what you do once you are right: S10 is primary for both in the master map — the data overturning the explanation everyone held, then one site's method becoming 25 sites' instrument with Finance's signature on the method before the number.	S10 (both) · backup: S16 (priced the status quo before build)

Answer strategy — business first, systems as enablers

- **Open with the process problem and its cost, not the system.** First sentence names the broken process (Plan, Source, Make, Deliver or Return), who it hurt (customer, Finance, the floor) and the baseline number. The platform appears only as the enabler of the redesign, in one clause.

- **Use the JD's four outcome words as the results frame:** reliability (did the promise hold?), responsiveness (how much earlier did we see it?), cost efficiency ($ with its basis label), asset utilization (capital, labor-hours, capacity released).
- **Action = operating-model redesign in gated phases** — Discovery → Plan & Design → Build & Test → Cutover → Hypercare, each spoken as entry bar · what I delivered · exit bar. Say the gate that fired, not the meeting that happened.
- **Every dollar carries its basis word in the same breath** — record · user anchor · modeled · priced. A record dollar is said flat; a modeled dollar is said with its inputs. Never promote a modeled number to record.
- **Program-lead voice.** I owned definitions, rules, gates and the signature chain; engineers, SIs and vendor teams configured and built to the spec I signed. The only platform personally configured in canon is Manhattan DOM.
- **The pitch ends on the primary metric.** Then stop. Silence after the pitch is the interviewer filling their STAR worksheet; their probes are the second half of the answer.
- **For the bar raiser specifically:** answer the LP asked, then stop — bar raisers fill their worksheet from probes, and over-answering gives them inconsistencies to find. When they switch LPs mid-story, keep the facts identical and change only the emphasis (the twist maps below are built for that). Volunteer the failure beat before they ask for it (S16's two weeks; S14's "what if he had said no").
- **Consistency is the bar:** every number must match what the other four interviewers heard. The consistency-rules box carries the never-say items that would show up as a discrepancy in the debrief: 9.7× not 50×; "six sites" not "six NA sites"; every dollar with its basis label; the $10M won, never saved; the >$100K priced, never claimed.
- **Customer lens (FBA):** name the customer in each story — the VP steering on a wrong number (S16), the QA lead and the release's end users (S15), the site and the carriers who could not dispute the scorecard (S10), the retail customer told first (S14).

Loop-consistency rule. One question, one story; never the same story to two interviewers — interviewers compare notes. Held for other packets (do not spend here): S11/S12 (Tripathy) · S6/S8 (Hoerger) · S2/S18 (Goforth) · S1/S3 (Lan). S16 is the same program family as S11 — if the bar raiser has read notes from the HM's interview, say so: "the review the HM heard about is the one this pipeline replaced.". If pushed for "another example" on an LP, use the named backup in the question bank or the backup bench at the end of this packet, never a story allocated to another interviewer.

How to read the "L6 level evidence" block under each story. Amazon's L6 functional bar (user-supplied rubric): *Ambiguity* — strategy or network undefined; I select the stakeholders, set the goals, deliver independently. *Scope & influence* — team-level scope; influences one to two levels up. *Execution* — tactical and strategic; simplifies or extends; applies best practices; force-multiplies; mitigates long-term risk; makes the short-versus-long-term trade-off explicit. *Impact* — long-term team goals. *Process improvement* — operational-excellence best practices institutionalized. *Complex* — visible risks, roadblocks and constraints mitigated through expertise, judgment and influence to consensus. Overview themes the block is tuned to: designing and modeling the supply chain rather than working in it; developing new processes for others to own; root-cause mechanisms that resolve trending issues at scale; recommendations to leadership that outline competing metrics. The block sits right after Results so the evidence is on the page when the probing starts.

Bar-raiser instruments — LP coverage and consistency rules

LP-coverage grid — which Leadership Principles each of the four stories can serve

Y = can open on this LP (the story is primary, backup or third for it in the master map, or the beat is explicit in the record) · **P** = a secondary angle, use only if the Y stories for that LP are spent · blank = do not stretch the story to it. Fifteen of sixteen LPs are covered by at least one Y or P across the four. The one gap is Think Big — its primary (S12) is the hiring manager's and its third (S1) is Lan's; if Think Big lands here, use the unallocated master-packet backup S9 (the 1,000-lane EDI vision, 597 built first behind a ≥95% valid-ASN gate — pointer-level detail only) or offer S16's four-systems-to-one as the nearest honest angle, labeled as such.

STORY	CO	OWN	I&S	ARL	L&C	H&D	IHS	TB	BFA	FRU	ET	DD	HB	DR	EBE	BR

S10 Elementum — Austria	P	P		Y			P			P	Y	Y	P	P		Y
S14 Manhattan — $2.5M	Y	Y							Y		Y		Y			P

CO Customer Obsession · OWN Ownership · I&S Invent and Simplify · ARL Are Right, A Lot · L&C Learn and Be Curious · H&D Hire and Develop the Best · IHS Insist on the Highest Standards · TB Think Big · BfA Bias for Action · FRU Frugality · ET Earn Trust · DD Dive Deep · HB Have Backbone; Disagree and Commit · DR Deliver Results · EBE Strive to be Earth's Best Employer · BR Success and Scale Bring Broad Responsibility

Consistency-rules box — the data a bar raiser cross-checks across stories and interviewers

Say it the same way in every room.

- **9.7×, never 50× and never 10×.** Flexport customers 7 → 68 = 9.7× (S11, the HM's story). If the bar raiser quotes a multiple back, correct it gently to 9.7×.
- **"Six sites," never "six NA sites."** The Elementum manufacturer is six sites; the CM-ingest program (S7) is six sites, three waves, five months — no region prefix, no "500+ product families."
- **Every dollar carries its basis label** — record · user anchor · modeled · priced. In this packet: $2.5M discrepancy (record) · $10M initiative (record — won, never saved) · >$100K/yr (priced, never claimed) · $500K/yr Austria and ~$8M across 25 sites (record roll-up) · ≈$0.13M/yr (S15, modeled) · ≈$0.1M/yr (S14, modeled) · ≈$0.5M/yr Austria analyst capacity (modeled).
- **Two $2.5M figures exist in my canon and they are different things:** S14's $2.5M is the OMS↔WMS discrepancy at Manhattan (record); S1's ≈$2.5M/yr is Sephora's book-of-record headline (anchor + modeled, Lan's story). Never let them blur.
- **Two ~$1.5M figures exist and neither is in this packet:** S8's ~$1.5M safety-stock release (record, Hoerger) and S11's ~$1.5M pre-production saving (record, Tripathy). S14's ≈$1.5M is *expected corruption avoided* — risk math, not money. Never "$1.5M to $2M."
- **Accuracy 60% → 90% appears twice honestly:** S16 (WBR data accuracy) and S11 (ETA accuracy) are the same program family — the pipeline moved the review's data accuracy; the waves moved ETA accuracy. Say which one.
- **Failure stories are consistent:** S16 — the two-week security-review miss, owned upward the same day; S18 (Goforth) — the RF miss; S4 (Lan's pointer) — the rule I got wrong. The lesson sentences are fixed: "security, privacy and data-access reviews are program dependencies with lead times"; "any single-point dependency in front of an exit criterion gets a what-if plan"; "both sides of a rule get a number before it ships."
- **Voice:** program lead who owned definitions, rules, gates and signatures; engineers, SIs and vendor teams built; the only platform personally configured in canon is Manhattan DOM (S13/S14 era). Never "we" for an action that was mine; name the team's part once.

- **No invented numbers:** no direct-report headcount (S15), no realized dollars on the $10M initiative (S14), no claimed savings on the >$100K (S16), no Austria "$1M" or "99% in two months" (S10). "I don't have a canonical figure and won't invent one; what I can defend is…"

The stories — one per employer, business-first, canon numbers

Order of preference if the bar raiser lets me choose: S14 (Earn Trust) → S16 (Ownership, with the failure beat) → S15 (Hire & Develop) → S10 (Are Right / Broad Responsibility). Each: 60-second pitch → Situation/Task → Action in gated phases → Results → Probing tuned to a bar raiser (fifth-why, customer, softest number) → the key math → Twist map.

S16 — Flexport — four systems into one Snowflake pipeline: writing a bus-factor-one operating metric out of my own hands, and the security-review miss I owned upward the day it surfaced

LPs this story can serve here: Ownership (primary — bus factor 1 → pipeline; owning the miss) · Invent and Simplify (backup — four systems → one) · Frugality (the >$100K priced baseline) · Learn and Be Curious (learned the stack to write the BRD) · Earn Trust (zero review deliveries skipped while paying for the miss)
Process family: Deliver — operating-metric production for a weekly business review; data-integrity and ownership of a decision instrument

Honesty label. I wrote the BRD and owned the cutover; the infra team owned the build. The >$100K/yr is a priced baseline in the infra team's own loaded rates — priced, not claimed as savings; my split of it (≈$30K hours + ≈$70K decision risk) is modeled. The two-week security-review miss is mine, owned upward the same day. Same program family as S11 (the HM's story) — never both to one interviewer.

60-SECOND BUSINESS-FIRST PITCH — STOP ON THE PRIMARY METRIC

Situation. The Monday business review that steered Flexport's visibility rollout ran on four systems that did not talk, stitched together in spreadsheets by one person — me. Bus factor one, data accuracy 60%, 1.5–2 hours per snapshot and rising, support tickets with no container ID so they could not be joined to anything. A VP was steering a program on a number one person could break and nobody could check. **Task.** Nobody had written requirements for a program's operating metrics; I wrote the business requirements and owned the cutover; the infrastructure team owned the build. **Action.** I documented the as-is and priced the status quo at more than $100K a year in the infra team's own loaded rates — my hours plus the decision risk of a VP steering on a wrong number — so that they prioritized the build themselves. The BRD froze the seven metric definitions, specified the feed, the failure alerts and a cross-reference table for the ticket join while the real key was pushed upstream, and set the acceptance gate: parallel run within 1% per metric for consecutive weeks, every mismatch explained by cause. Mid-build a data-access security review surfaced that I had not planned; it cost two weeks. I owned it upward the same day as a scoping miss, re-sequenced the build, and kept the review alive on the manual pull — zero Mondays skipped. The deck moved onto the pipeline when parity held; the manual pull stayed as rollback a week beyond. **Result.** Primary metric: review data accuracy 60% → 90% once four systems became one pipeline; bus factor one to at least two; the first automated catch was a 4% ticket-sync drop that had been invisible in the manual era. The >$100K a year is a priced baseline, not a claimed saving. Lesson: every kickoff now asks whose approval the data needs and what its lead time is.

SITUATION / TASK — THE BUSINESS PROCESS PROBLEM, SCOPE, SCALE, BASELINES

S — The Monday review ran on four systems that didn't talk, stitched in Google Sheets by one person — me: bus factor 1, accuracy 60%, 1.5–2 hours per snapshot, tickets carried no container ID. A VP was steering on a number one person could break.

The cost of leaving it: a wrong number steering the rollout, and silent data loss nobody would catch — the 4% ticket-sync drop was invisible in the manual era. The customer in this story is the VP making rollout and funding decisions on the number.

T — Nobody had written requirements for a program's operating metrics. I wrote the BRD and owned the cutover; the infra team owned the build. Goal: one pipeline producing the same seven numbers, accurate, and owned by more than one human.

Baselines on the table: WBR accuracy 60% · bus factor 1 · snapshot effort 1.5–2 hours per Monday, heading to ~4 hrs/wk · ticket-to-container joinability none · no alarm on silent data loss.

ACTION — THE PROCESS / OPERATING-MODEL REDESIGN, IN GATED PHASES

- **Discovery** — documented the as-is; named the join gap (tickets without container ID); priced the status quo at >$100K/yr in the infra team's own rates including VP decision risk. *Exit bar:* infra prioritizes it themselves off the price; scope = the seven metrics, nothing new.
- **Plan & Design** — the BRD — seven frozen definitions, daily/hourly feed, failure alerts, cross-reference table then a real key upstream; acceptance = parallel run within 1% for consecutive weeks; the RAID log — missing the data-access security review. *Exit bar:* BRD accepted by infra; acceptance gate published.
- **Build & Test** — extract/load specs per system; parity checks; the parallel-run procedure; when the security review surfaced mid-build, re-sequenced and owned the miss upward the same day. *Exit bar:* review closed (2 weeks); parallel run within 1% for consecutive weeks; mismatches explained (mostly late-arriving tickets on the manual side).
- **Cutover & Go-Live** — the cutover memo; the Monday deck moved onto the pipeline; the manual pull kept as rollback. *Exit bar:* first Monday off the pipeline, same seven numbers; zero review deliveries skipped through the build.
- **Hypercare / Close** — watched the failure alerts; triaged the first automated catch (a 4% ticket-sync drop); definitions into code; institutionalized the kickoff question. *Exit bar:* accuracy 60% → 90%; the pipeline steers the review without me.

Influence and ownership. The build was the infra team's — the ETL → S3 → SQS → Snowflake → Looker pipeline and the alerts; mine were the as-is, the pricing, the BRD's frozen definitions, the acceptance gate, the parallel-run procedure and the cutover memo. The lever was pricing the status quo in the owning team's own loaded rates — including decision risk, not just hours — so they prioritized it themselves. The category error was mine: I treated the security review as an engineering concern rather than a program dependency with a lead time.

> **Designed the process; others own it now.** I designed the BRD, the acceptance gate and the cutover memo; the infra team owns the pipeline and its alerts, and the definitions live in code rather than in a person. **Trade-off put to leadership.** The recommendation to the infra lead and the VP outlined the competing metrics — build speed vs the data-access security review and decision risk on the Monday numbers — and re-sequenced the build rather than route around the review.

RESULTS — $ · # · % · TIME · CUSTOMER · QUALITY (CANON NUMBERS ONLY)

- **$** — >$100K/yr priced baseline in the infra team's own loaded rates (record of the pricing) — priced, *not* claimed as savings; my model splits it ≈$30K hours + ≈$70K decision risk (≈$50K of which the accuracy gain retires), both modeled; bus-factor exposure ≈$15K/yr modeled.
- **#** — four systems → one pipeline; bus factor 1 → ≥2; zero review deliveries skipped through the build (record).
- **%** — review data accuracy 60% → 90%; parity within 1% for consecutive weeks; first automated catch a 4% ticket-sync drop (record).
- **Time** — the security-review miss cost two weeks — owned upward the same day, build re-sequenced, review closed (record).
- **Customer** — the VP steered on the same seven numbers the first Monday off the pipeline; the manual pull stayed as rollback until parity had held a week beyond (record).
- **Quality** — seven frozen definitions moved into code (no drift); every parallel-run mismatch explained by cause (record).

L6 LEVEL EVIDENCE — what the interviewer pattern-matches against the Amazon L6 functional rubric; every line is this story's canon, no new numbers

L6 DIMENSION	EVIDENCE IN THIS STORY
Ambiguity	A Monday review fed by a manual pull across four systems with a bus factor of one, owned by nobody. I documented the as-is, named the join gap (tickets without container ID) and priced the status quo at >$100K/yr in the infra team's own loaded rates.
Scope & influence	The infra team — not mine — prioritized the build off the price; the VP steered the review off the pipeline from the first Monday; my seat was the BRD, the acceptance gate and the cutover memo.
Execution trade-off + mechanism others now own	Build speed vs the data-access security review: when it surfaced mid-build I re-sequenced and owned the miss upward the same day (two weeks). Mechanisms others own now: the pipeline and its failure alerts (infra), the seven frozen definitions in code.
Impact (long-term)	Four systems → one pipeline; bus factor 1 → ≥2; review data accuracy 60% → 90%; the pipeline steers the review without me.
Process improvement (standard work institutionalized)	Acceptance = parallel run within 1% for consecutive weeks; the parallel-run procedure and cutover memo; the manual pull kept as rollback until parity held a week beyond; the kickoff question institutionalized (which reviews belong in the RAID log).
Complexity & consensus	Zero review deliveries skipped through the build; the security review treated as a dependency with a lead time rather than argued around.
Root cause at scale	The join gap fixed as a cross-reference table then a real key upstream; the first automated catch — a 4% ticket-sync drop — triaged by cause, not patched by hand.

PROBING — CHALLENGE Q&A TUNED TO THIS INTERVIEWER

BR — Why is this Ownership and not just automation?

Both halves are ownership: taking the bus-factor-one system I had built and writing it out of my own hands, and owning the security-review miss upward the same day it surfaced — with zero review deliveries skipped while I paid for it.

BR — You are claiming $100K of savings?

No — pricing, not claiming. The number existed to make the infra team prioritize the build off their own rates, and it worked. The claimed record is the accuracy move and the first automated catch; the split of the price is my model and I will not call any of it realized savings.

BR — Why didn't you know about the security review? Fifth why.

Because I treated it as an engineering concern rather than a program dependency with a lead time — a category error, not a scheduling slip. The fix is institutional: every kickoff now asks whose approval the data needs and what its lead time is. I would trade the two weeks again; I would plan them now.

BR — Who was the customer and what did they experience?

The VP steering the rollout. What they experienced was continuity — the same seven numbers on the first Monday off the pipeline, zero skipped Mondays — and then a capability they never had: an alert instead of silence when 4% of tickets stopped syncing.

BR — The decision-risk dollar is soft.

Yes — one wrong number in ten becoming a wrong steer worth a squad-week; range $12K to $117K. I would firm it by tagging every review action item for a quarter and counting how many were reversed when a number was corrected.

BR — How does this connect to the review the hiring manager heard about?

It is the same program: the review in S11 ran by hand for over a year; this pipeline is what retired the manual pull, with the definitions in code. Different story, same facts.

THE KEY MATH — THE PARITY GATE, THE PRICED BASELINE AND ITS SPLIT (RECORD GATE; ILLUSTRATIVE VALUES LABELED)

STEP	QUANTITY	FORMULA → SUBSTITUTION	BASIS	VALUE
1	Parity gate	`|pipeline − manual| / manual ≤ 1% per frozen metric, consecutive weeks`	BRD acceptance gate (record)	cutover unarguable
2	Pass example	`|70.9 − 71.2| / 71.2 = 0.42% ≤ 1%`	illustrative coverage values	pass
3	Investigate example	`|461 − 456| / 456 = 1.1% > 1%`	illustrative ticket counts	5 late tickets — the manual side was wrong
4	Silence alert	`1 − 0.96 = 4% > 1% threshold → alert`	threshold illustrative; the 4% catch is record	first automated catch
5	Hours term	`4 h/wk × 52 = 208 h × ≈$145/h ≈ $30K`	modeled, consistent with infra's pricing	≈$30K/yr
6	Decision-risk term	`52 × 10% = 5.2 wrong-number weeks × $13.5K ≈ $70K`	illustrative; range $12–117K	≈$70K/yr
7	Priced baseline	`30 + 70 = >$100K/yr`	record of the pricing — NOT claimed savings	>$100K/yr priced

Accuracy 60 → 90% here is the review's data accuracy; S11's 60 → 90% is ETA accuracy — same program family, two different metrics.

Where this lands at Amazon. The Ownership pattern: price the status quo in the owning team's own rates so they prioritize it themselves, keep the old path alive until the new one has earned parity, and treat security, privacy and data-access reviews as dependencies with lead times. Reliability (a number that survives its author), responsiveness (alerts instead of silence), cost efficiency (priced, honestly).

TWIST MAP — LIKELY LP QUESTIONS FROM THIS INTERVIEWER → THE ANGLE TO TAKE WITH S16

LIKELY QUESTION (THIS INTERVIEWER)	LP	ANGLE — WHAT TO EMPHASIZE	SKIP / NEVER SAY
Tell me about a time you took ownership of a problem that wasn't yours to fix.	Ownership	Nobody had written requirements for operating metrics; I wrote the BRD and wrote myself out of the system I had built.	Do not claim the build — infra built; I owned BRD and cutover.
Tell me about a mistake and what you learned.	Ownership / Earn Trust	The security review: two weeks, owned upward the same day, zero Mondays skipped; the kickoff question that outlived it.	Do not minimize it as "a dependency slipped" — it was my scoping miss.
Tell me about simplifying something.	Invent and Simplify	Four systems → one pipeline; seven definitions into code; a cross-reference table now, the real key upstream.	Skip the ETL stack names unless asked.
Tell me about a time you made a business case.	Frugality	The status quo priced at >$100K/yr in the owner's own rates — including decision risk; it got prioritized.	Never "saved $100K."
How do you know when a new system can replace the old one?	Highest Standards	Parity within 1% per metric for consecutive weeks; mismatches explained by cause; old path alive a week beyond.	—

LIKELY QUESTION (THIS INTERVIEWER)	LP	ANGLE — WHAT TO EMPHASIZE	SKIP / NEVER SAY
Tell me about learning something outside your expertise.	Learn and Be Curious	Learned enough of the data stack to write a BRD infra could build from; the first requirements ever written for a program's metrics.	Do not overclaim engineering depth.

S15 — Sephora — converting a 20-person Product/Engineering/QA team to a four-week cadence in six weeks, by handing the gate to the skeptic (critical defects per release −50%)

LPs this story can serve here: Hire and Develop the Best (primary — the QA lead who now owns the gate) · Strive to be Earth's Best Employer (primary — QA elevated, not blamed) · Insist on the Highest Standards (the definition-of-done that can say no) · Have Backbone (naming QA's fear as correct)
Process family: Make — product delivery operating model: release cadence, definition-of-done, quality gate ownership

Honesty label. VP air cover, no line authority over anyone in the room; the QA lead authored the definition-of-done — I coached the frame, she owned the gate. The −50% and the six weeks are record; the dollars are my model on illustrative defect counts. Never invent a direct-report headcount.

60-SECOND BUSINESS-FIRST PITCH — STOP ON THE PRIMARY METRIC

Situation. Newly joined at Sephora, the VP of Supply Chain asked me to move a 20-person Product, Engineering and QA team from a six-week hybrid cadence to four-week agile. QA — a contracting firm — and in-house engineering were heading for a standoff: QA feared compressed test windows, and the arithmetic said they were right. The business cost of getting it wrong was a faster cadence shipping more escaped critical defects — the one outcome the VP could not afford. **Task.** Convert the cadence in weeks, not quarters, without line authority and without the standoff becoming the story; success was the four-week cadence with no rise in escaped criticals and the QA window protected by rule. **Action.** One-on-ones with every person first, an influencer named per function, and the problem stated honestly — QA's fear is correct. Then I handed the load-bearing artifact to the most skeptical person: the QA lead authored the definition-of-done with entry criteria that could say no; I coached the frame, she owned the content, engineering shaped it through review rather than veto. Jira got benefit-ranking and review-status fields; late heavy stories got a drop date with a reason code instead of a silent slide into the last two days; QA sat on the product-business calls with pre-approved scenarios so Sev-1s were classified by cause, not blamed. I facilitated the retrospective once and stepped back from the review line. **Result.** Primary metric: critical defects per release — baseline → −50%, while shipping 50% more releases; the 20-person team on a four-week cadence in six weeks; the gate defended by its owner to engineering without me by cycle two, and it survived my leaving. About $130K a year modeled — escaped-critical cost avoided and late-land rework removed — and none of it is a record figure; no headcount was invented to get there.

SITUATION / TASK — THE BUSINESS PROCESS PROBLEM, SCOPE, SCALE, BASELINES

S — Newly joined, the VP of Supply Chain asked me to move a 20-person Product/Engineering/QA team from a six-week hybrid cadence to four-week agile. QA (a contracting firm) and engineering (in-house) were heading for a standoff: QA feared compressed test windows — and they were right.

The risks: the standoff becoming the story, dev consuming the shrunken test window, Sev-1s mis-attributed to QA — and a faster cadence shipping more escapes, the exact failure the VP could not afford. The customers: the release's end users in supply chain operations, and the QA team who would otherwise be blamed for the arithmetic.

T — Convert the cadence in weeks, not quarters, without the standoff becoming the story. VP air cover, no line authority over anyone in the room. Success criteria written with the VP: four-week cadence, no rise in escaped criticals, QA window protected by rule.

Baselines on the table: release cadence six-week hybrid (≈8.7 releases/yr) · escaped critical defects per release — the baseline the −50% is measured against (count illustrative; the −50% is record) · the QA test window being compressed by arithmetic.

ACTION — THE PROCESS / OPERATING-MODEL REDESIGN, IN GATED PHASES

- **Discovery (weeks 1–2)** — one-on-ones with every person (objections, motivations); an influencer per function; the problem statement — QA's fear is correct — and the success criteria. *Exit bar:* every function's real objection heard privately; the QA lead agreed to author the gate.
- **Plan & Design (weeks 2–3)** — ceremony calendar for a four-week cycle; the definition-of-done frame (what a gate needs to survive pressure — the QA lead wrote the content); Jira field spec (benefit ranking, review status); user-guide outline. *Exit bar:* DoD with entry criteria written by QA and reviewed with engineering; fields live.
- **Build & Test (weeks 3–5)** — the user guide (grooming → completion); live dashboard; the QA drop date with reason codes; QA seated on product-business calls with pre-approved scenarios. *Exit bar:* cycle 1 completed on the new cadence; drop-date rule in force; Sev-1 cause classification running.
- **Cutover (week 6)** — facilitated the retro once; data read-out to the VP; handed the gate to the QA lead to defend herself; rollback (reverting to six weeks) named as a two-way door at kickoff and never used. *Exit bar:* converted in 6 weeks; critical defects −50% under the drop-date rule.
- **Hypercare / Close** — stepped back from the review line; neighbouring teams copied the ceremony from the user guide. *Exit bar:* the gate survived my leaving; Sev-1 trend from story-accuracy defects reversed.

Influence and ownership. Mine: the one-on-ones, the ceremony calendar, the DoD frame, the Jira field spec, the drop-date rule and the retro — facilitated once. Hers: the DoD content and the gate, defended by her. Engineering's objection became co-ownership through review, not veto, with me covering the low-impact stories they had to drop. The assumption I challenged was that QA's fear was resistance — it was correct arithmetic, and saying so is what made the QA lead willing to author the gate.

> **Designed the process; others own it now.** I designed the ceremony calendar, the DoD frame and the drop-date rule; the QA lead owns the gate and defends it, and neighbouring teams copied the ceremony from the user guide. **Trade-off put to leadership.** The read-out to the VP outlined the competing metrics — release frequency (8.7 → 13 per year, modeled) vs escaped critical defects — and showed both moving the right way under a gate that could say no.

RESULTS — $ · # · % · TIME · CUSTOMER · QUALITY (CANON NUMBERS ONLY)

- **$** — ≈$130K/yr *modeled* (escaped-critical cost avoided ≈$90K + late-land rework removed ≈$40K; range $80–270K); none of it is a record figure, and no headcount was invented to get there.
- **#** — 20-person Product/Eng/QA team; releases per year 8.7 → 13 (*modeled* from the cadence: 52 ÷ cycle weeks).
- **%** — critical defects per release −50% (record) — while shipping 50% more releases.
- **Time** — six-week hybrid → four-week agile, converted in six weeks (record); the QA lead defending the gate by cycle 2.
- **Customer** — QA moved from blamed afterthought to owner of the standard, with the data protecting them; end users got more frequent releases with fewer escaped criticals (record mechanism).
- **Quality** — a QA-authored definition-of-done with entry criteria that can say no; the drop date with reason codes; Sev-1 cause classification — and the gate survived my leaving (record).

L6 LEVEL EVIDENCE — what the interviewer pattern-matches against the Amazon L6 functional rubric; every line is this story's canon, no new numbers

L6 DIMENSION	EVIDENCE IN THIS STORY
Ambiguity	A VP ask to change a 20-person team's cadence, with QA and engineering heading for a standoff and no line authority over anyone in the room. I chose an influencer per function and set the success criteria.
Scope & influence	20-person Product/Engineering/QA team with VP air cover; the QA lead authored and defended the gate; neighbouring teams copied the ceremony from the user guide — influence by frame, not by rank.
Execution trade-off + mechanism others now own	Release frequency (8.7 → 13/yr modeled) vs test-window quality: a QA-authored definition-of-done with entry criteria that can say no, and a drop date with reason codes. Mechanism others own now: the gate, owned and defended by the QA lead.
Impact (long-term)	Critical defects per release −50% while shipping 50% more releases; the gate survived my leaving; the Sev-1 trend from story-accuracy defects reversed.
Process improvement (standard work institutionalized)	A ceremony calendar for the four-week cycle; Jira benefit-ranking and review-status fields; Sev-1 cause classification; a user guide (grooming → completion) that other teams reused.
Complexity & consensus	QA (a contracting firm) vs engineering (in-house): engineering's objection became co-ownership through review, not a veto; rollback to six weeks named as a two-way door at kickoff and never used.
Root cause at scale	QA's fear was correct arithmetic about compressed windows — addressed by a mechanism (DoD + drop date), not a heroics week, so the defect reduction held across cycles.

PROBING — CHALLENGE Q&A TUNED TO THIS INTERVIEWER

> **BR — Why is this Hire and Develop? You had no reports.**
>
> Because the development mechanism is the story, not the org chart: the most skeptical person authored the load-bearing artifact; I coached the frame, she owned the gate, and she was defending it to engineering without me by cycle two. Development that depends on me staying is not development. I have managed onshore/offshore delivery teams earlier in my career; I have not run a large HR org with comp cycles and won't claim that muscle.

> **BR — Faster cadence usually means more escapes. Why did yours fall?**
>
> Because the gate got stronger as the window got shorter: entry criteria authored by the person with the most to lose, and a drop date that converted silent late lands into visible, reason-coded re-scopes. The −50% is the record; the defect counts behind the dollars are illustrative and labeled.

> **BR — Where does four criticals per release come from?**
>
> It is illustrative, not record — the record gives me the fifty percent drop, not the base count. I would pull the Sev-1 log for the last four six-week releases and use the actual mean.

> **BR — What did engineering give up, and how did you handle it?**
>
> Low-impact stories dropped under the drop-date rule — dev's date protected, QA's window protected, and I covered some of the drops myself. Their objection to the DoD became co-ownership through review, not veto.

> **BR — Fifth why: why hand the artifact to the skeptic?**
>
> A gate the skeptic owns survives pressure; one I write dies when I leave. And naming her fear as correct arithmetic is what made her willing to write it — the standoff was never about resistance.

> **BR — What would you do differently?**
>
> Go to QA first, and put her name on the review line from week one.

THE KEY MATH — CADENCE TO RELEASES, CRITICALS PER YEAR, AND THE MODELED DOLLARS

(RECORD −50% AND SIX WEEKS; COUNTS ILLUSTRATIVE)

STEP	QUANTITY	FORMULA → SUBSTITUTION	BASIS	VALUE
1	Releases per year	`52 / 6 = 8.7 → 52 / 4 = 13 (+50%)`	record cadence; arithmetic	8.7 → 13
2	Criticals per release	`4 → 2 (−50%)`	record −50%; base count illustrative	−50%
3	Criticals per year	`4 × 8.7 ≈ 35 → 2 × 13 = 26; 9 fewer`	illustrative counts	9 fewer/yr while shipping 50% more
4	Escaped-critical cost avoided	`9 × $10,000 = $90,000`	benchmark $8–15K per critical (modeled)	≈$90K/yr
5	Late-land rework removed	`6 person-days × $800 × 8.7 ≈ $41,760 → ~0 under the drop rule`	modeled	≈$40K/yr
6	The constraint	`15 eng × 18 d / 3 = 90 stories vs 4 QA × 18 d / 1 = 72 stories`	theory-of-constraints illustration (toolkit label)	QA caps throughput — QA was right
7	Total	`90 + 40 = $130K`	modeled; range $80–270K; no headcount invented	≈$130K/yr

Count per year, not per release — halving per release at 13 releases still nets nine fewer a year; the VP feels escaped criticals per quarter.

Where this lands at Amazon. Develop people by giving them the load-bearing artifact and the frame, not by writing it for them — and measure development by whether the gate survives your leaving. The Earth's Best Employer angle: QA moved from blamed afterthought to owner of the standard, with the data protecting them. Reliability (fewer escaped criticals), responsiveness (50% more releases), quality owned at the source.

TWIST MAP — LIKELY LP QUESTIONS FROM THIS INTERVIEWER → THE ANGLE TO TAKE WITH S15

LIKELY QUESTION (THIS INTERVIEWER)	LP	ANGLE — WHAT TO EMPHASIZE	SKIP / NEVER SAY
Tell me about a time you developed someone.	Hire and Develop the Best	The QA lead: frame coached, content hers, gate defended by her by cycle 2 and after I left.	Never invent a direct-report headcount.
Tell me about making a workplace better for a team.	Earth's Best Employer	QA from blamed to owner; Sev-1s classified by cause, not blame; the drop date made overload visible and got people help.	Do not claim engagement or attrition numbers — none exist.
Tell me about a time you raised the bar on quality.	Highest Standards	A definition-of-done that can say no, evaluated at Ready-for-QA; criticals −50% at +50% releases.	Keep the per-release base count labeled illustrative.
Tell me about resolving a conflict between two teams.	Earn Trust / Backbone	One-on-ones first; QA's fear named as correct arithmetic; engineering's veto turned into review.	Do not make engineering the villain.
How do you change a process without authority?	Functional — change management	Hear every real objection privately; hand the artifact to the skeptic; name the rollback as a two-way door; step back on evidence.	—
Tell me about a change that stuck after you left.	Deliver Results / Ownership	Neighbouring teams copied the ceremony; the gate survived my leaving.	No dollars as record — ≈$130K is modeled.

S10 — Elementum — Austria: "the noise said carriers; the data said measurement" — routing-guide data quality ~55% → ~99% in three months, $500K/yr on a Finance-signed method, then ~$8M across 25 sites

LPs this story can serve here: Are Right, A Lot (primary — the data overturned the room's explanation) · Success & Scale Bring Broad Responsibility (primary — one site's fix rolled to 25 sites) · Dive Deep (backup — measured the measurement) · Earn Trust (the Finance-signed method before any dollar) · Customer Obsession (a scorecard the carriers could not dispute)

Process family: Deliver — transportation performance measurement (on-time delivery), routing-guide governance, freight-savings control

Honesty label. I owned the analysis and the rules design and pulled the data myself; the data platform team built the engine; Finance signed the savings method before any dollar was claimed. Site-wave counts and dates beyond "Austria first, then 25 sites" are not in the record. Guardrails: $8M, never "$1M"; "~99% in 3 months," never "two months"; 1–2 hrs/wk is the after, never the before.

60-SECOND BUSINESS-FIRST PITCH — STOP ON THE PRIMARY METRIC

Situation. Transportation at the customer's Austria site could not measure on-time delivery. Reports said data quality was 40%; the team spent 8–10 hours a week reconciling promised against actual dates by hand; the freight base was about $5M a year with no enforceable on-time standard — and everyone, including my own sponsor, believed the carriers were late. **Task.** I owned the analysis and the rules design; the goal was an on-time number the carriers could not dispute, and savings claimed only on a method Finance signed first. **Action.** I pulled three years of shipment history in SQL myself — the room already had an explanation, and a request queue would have been slower and arguable. True data quality was about 55%, not 40%, and the defects were ours: missing rates, wrong-grain lanes, one carrier under five spellings, brochure transit times posing as promises. The problem was measurement, not carriers. I specified the promised-delivery-date as a routing-guide rules engine — lane key by ship-from, ship-to, mode, volume band, Incoterm and SLA, with Incoterm needed on about 8% of lanes and a no-hit paging a human rather than defaulting a carrier; defects worked as classes with reason-code alerts and a weekly burn-down; and the savings method signed with Finance before the number existed — contracted guide rate minus paid rate, per shipment, executed only. The scorecard was released only when automated on-time matched a manual sample per lane cohort; the sponsor was unhappy with the delay for weeks and right to want speed; the carriers never disputed the result. Then scale: a rules file plus one data-quality cycle per site, regional super-users after two shadowed reviews. **Result.** Primary metric: routing-guide data quality — about 55% true, 40% reported → about 99% in three months. $500K a year at Austria, 10% of the freight base on the Finance-signed, executed-only method, then about $8M across 25 EU sites and 400-plus lanes — both record; manual reconciliation 8–10 → 1–2 hours a week; about $0.5M a year of analyst capacity modeled on top.

SITUATION / TASK — THE BUSINESS PROCESS PROBLEM, SCOPE, SCALE, BASELINES

S — Transportation at the customer's Austria site could not measure on-time delivery. Reports said data quality was 40%; the team spent 8–10 hours a week reconciling promised vs actual dates by hand; the freight base was ≈$5M/yr with no enforceable OTD. Everyone — the site, the carriers' account teams, my own sponsor — believed the carriers were late.

The cost of acting on the room's explanation: a scorecard on 55% data the carriers would dispute and win, the manual reconciliation continuing at every site, and any savings claim disputed after the fact. The customers: the site that needed an enforceable standard, and the carriers who deserved to be measured against a real promise.

T — Own the analysis and the rules design. Goal: an OTD the carriers could not dispute, and savings claimed only on a method Finance signed first. The real challenge: the data had to overturn the room's explanation.

Baselines on the table: routing-guide data quality 40% reported, ~55% true once measured · manual reconciliation 8–10 hours a week per site · enforceable OTD: none, on a ≈$5M/yr freight base.

ACTION — THE PROCESS / OPERATING-MODEL REDESIGN, IN GATED PHASES

- **Discovery** — pulled three years of shipment history in SQL myself; defect census (missing rates, wrong-grain lanes, five spellings of one carrier, brochure transit times); true DQ ~55% vs 40% reported; the problem reframed as measurement, not carriers. *Exit bar:* sponsor accepts the reframe on the evidence; defect classes named and counted.
- **Plan & Design** — rules-engine spec (lookup by ship-from/to, mode, volume, Incoterm, SLA; a no-hit pages a human, never a default carrier); reason-code alert design; the savings method signed with Finance before any dollar was claimed (contracted guide rate − paid rate, per shipment, executed only); the scorecard DQ gate (automated OTD = manual sample per lane cohort). *Exit bar:* spec signed by transportation; Finance method signed; scorecard gate published.
- **Build & Test** — held engineering to the spec; weekly defect burn-down by reason code; manual-sample comparison per lane cohort (≈97% agreement). *Exit bar:* DQ trending to ~99%; automated OTD matches the manual sample per cohort.
- **Cutover & Go-Live (Austria)** — released the carrier scorecard only after the gate passed; retired the manual reconciliation (8–10 → 1–2 hrs/wk); stood up the savings ledger per shipment. *Exit bar:* a scorecard the carriers could not dispute; $500K/yr on the Finance-signed method.
- **Hypercare / Close → scale** — super-user model per region; one-page runbook (add a lane · read a no-hit · when to escalate); two shadowed rule reviews per site; rolled out site by site. *Exit bar:* 25 EU sites / 400+ lanes ≈ $8M; ~99% DQ; adoption cost per site = a rules file + one DQ cycle, in days.

Influence and ownership. I pulled the data myself because the room already had an explanation; the data platform team built the engine; regional super-users ran the rules files after two shadowed reviews each. Mine: the SQL pull, the defect census, the rules-engine spec, the reason-code alert design, the Finance-signed method and the scorecard gate. The sponsor was unhappy with the delay for weeks — answered with the defect classes trending down weekly and the manual-sample gate; he was right to want speed, and the carriers never disputed the result. Refused: a scorecard on 55% data, a silent default carrier on a no-hit, and any savings number without a Finance-signed method.

> **Designed the process; others own it now.** I designed the rules-engine spec, the reason-code alerts and the savings method; regional super-users run the rules files and the DQ cycle at 25 sites without me. **Trade-off put to leadership.** The recommendation to the sponsor and Finance outlined the competing metrics — speed to a carrier conversation vs a baseline the carriers could not dispute — and held the scorecard until DQ reached ~99%, with savings counted executed-only.

RESULTS — $ · # · % · TIME · CUSTOMER · QUALITY (CANON NUMBERS ONLY)

- **$** — $500K/yr at Austria — 10% of a ~$5M freight base on the Finance-signed, executed-only method (record) — then ~$8M across 25 EU sites / 400+ lanes (record roll-up; ~$320K/site average, derived); plus ≈$0.5M/yr *modeled* analyst capacity (range $0.2–0.7M).
- **#** — 25 EU sites / 400+ lanes on the same rules file and one DQ cycle each; three years of shipment history pulled in SQL for the baseline (record).
- **%** — routing-guide data quality ~55% true (40% reported) → ~99% in 3 months (record); ≈97% agreement automated vs manual sample.
- **Time** — ~99% DQ in 3 months; adoption cost per site = a rules file + one DQ cycle, in days (record).
- **Customer** — a carrier scorecard the carriers could not dispute — automated OTD matched the manual sample per lane cohort before release (record).

- **Quality** — manual reconciliation 8–10 → 1–2 hrs/wk per site; the savings method signed with Finance before any dollar; negotiated-but-not-executed never counted (record).

L6 LEVEL EVIDENCE — what the interviewer pattern-matches against the Amazon L6 functional rubric; every line is this story's canon, no new numbers

L6 DIMENSION	EVIDENCE IN THIS STORY
Ambiguity	The room already had an explanation — "the carriers." I pulled three years of shipment history in SQL myself, built the defect census and reframed the problem as measurement; the sponsor had not asked for that.
Scope & influence	The data platform team built the engine; regional super-users ran the rules files after two shadowed reviews each; Finance signed the savings method before any dollar; the sponsor, unhappy with the delay for weeks, was answered with the defect census.
Execution trade-off + mechanism others now own	Speed (a carrier beating now) vs a baseline that could not be disputed: DQ to ~99% before any scorecard was released. Mechanisms others own now: a rules file + one DQ cycle per site, the super-user model, the one-page runbook and the Finance-signed, executed-only savings method.
Impact (long-term)	$500K/yr at Austria (record) → ~$8M across 25 EU sites / 400+ lanes (record roll-up); manual reconciliation 8–10 → 1–2 hrs/wk per site.
Process improvement (standard work institutionalized)	Reason-code alerts; weekly defect burn-down by reason code; a no-hit pages a human, never a default carrier; adoption cost per site measured in days.
Complexity & consensus	A carrier scorecard the carriers could not dispute — automated OTD matched the manual sample per lane cohort (≈97% agreement) before release.
Root cause at scale	Five spellings of one carrier, wrong-grain lanes and brochure transit times were the trending cause — fixed in the rules engine and the DQ cycle once, then rolled to 25 sites.

PROBING — CHALLENGE Q&A TUNED TO THIS INTERVIEWER

> **BR — Everyone believed the carriers were late. How did you know they were wrong?**
>
> I didn't — I measured. Three years of shipment history in SQL showed true data quality was about 55%, not the 40% proxy, and the defects were ours: missing rates, wrong-grain lanes, five spellings of one carrier, brochure transit times posing as promises. The data overturned the explanation; I did not argue with it.

> **BR — Is the $8M real? Fifth why.**
>
> It is the Finance-signed, executed-only method applied at each site, not a projection: contracted guide rate minus paid rate, per shipment, only on shipments that moved at the guide rate. Negotiated-but-not-executed never counted. The $500K Austria pilot is the method's proof; the $8M is the same ledger across 25 sites; what firms it is the per-shipment ledger Finance read. The assumption underneath is that the ten percent held elsewhere — Austria at $500K sits above the ~$320K/site average because it was a larger site.

> **BR — Your sponsor wanted speed and you delayed weeks. Defend that.**
>
> I traded date for evidence, never scope: a scorecard on 55% data would have been disputed and the carriers would have won. I showed him the defect classes trending down weekly and the gate the scorecard had to pass. He was right to want speed; the carriers never disputed the result.

> **BR — What is Broad Responsibility here?**
>
> One site's fix became 25 sites' instrument — and the responsibility was in the method: the savings rule was signed before the number so no site could claim what it had not executed, and a no-hit paged a human rather than silently defaulting a carrier.

> **BR — Who was the customer?**
>
> The site, which needed an enforceable standard; and the carriers, who deserved to be measured against a real promise — the scorecard's legitimacy with them is why the savings held.

> **BR — What would you do differently?**
> Start with the industry benchmark for lane transit times instead of proving the brochure wrong lane by lane — same answer, faster. And sign the method before the number — which held, and which I would do again.

THE KEY MATH — TRUE DQ, THE PROMISED-DATE RULE, THE SAVINGS METHOD AND THE ROLL-UP (RECORD FIGURES; AVERAGES DERIVED AND LABELED)

STEP	QUANTITY	FORMULA → SUBSTITUTION	BASIS	VALUE
1	Reported vs true DQ	`40% (field-populated proxy) vs valid promised ∧ valid actual ∧ resolvable lane ≈ 55%`	record	~55% true
2	Promised-date rule	`promised = ship_date + transit(lane_key); lane_key = (from, to, mode, volume band, Incoterm, SLA)`	record design; Incoterm on ~8% of lanes; no-hit pages a human	a promise per shipment
3	OTD definition + gate	`OTD = actual ≤ promised / valid promises; automated vs manual sample ≈ 97% agreement per cohort`	record	gate before release
4	Austria savings	`$5,000,000 × 10% = $500,000/yr`	record; Finance-signed, executed-only	$500K/yr
5	Network roll-up	`~$8M / 25 sites = ~$320K/site; / 10% ≈ $80M implied base`	record roll-up; averages derived	~$8M
6	Analyst capacity	`(9 − 1.5) h/wk × 25 sites × 50 wk × $55 ≈ $515K`	modeled add-on	≈$0.5M/yr modeled

Never "$1M routing guide"; never "99% in two months"; 1–2 hrs/wk is the after.

Where this lands at Amazon. The cleanest "used data to overturn the room's explanation" story — and the model for how a savings claim should be built: method signed with Finance before the number, executed-only, then scaled site by site with the adoption cost measured in days. Reliability (an enforceable promise), cost efficiency ($500K → ~$8M record), asset utilization (analyst hours returned, modeled).

TWIST MAP — LIKELY LP QUESTIONS FROM THIS INTERVIEWER → THE ANGLE TO TAKE WITH S10

LIKELY QUESTION (THIS INTERVIEWER)	LP	ANGLE — WHAT TO EMPHASIZE	SKIP / NEVER SAY
Tell me about a time you were right and others were wrong.	Are Right, A Lot	The measurement reframe on three years of data; the fix was a rules engine, not a carrier beating.	Do not gloat — the sponsor was right to want speed.
Tell me about a time your work had impact beyond your team / site.	Broad Responsibility	Austria's method → 25 sites / 400+ lanes ≈ $8M; adoption in days; super-users after two shadowed reviews.	Never "$1M"; never claim site-wave counts or dates beyond "Austria first."
Tell me about a time you dug into data others had accepted.	Dive Deep	Pulled the SQL myself; the defect census; true DQ ~55% vs 40% reported.	S8 (measured lanes) is Hoerger's — do not use it here.
How do you make a savings claim credible?	Earn Trust / Frugality	Finance signs the method before the number; executed-only; negotiated never counted; the ledger per shipment.	—
Tell me about a time you delayed a launch.	Highest Standards / Backbone	The scorecard held until automated OTD matched the manual sample per cohort; sponsor unhappy for weeks; carriers never disputed it.	Never "99% in two months."

LIKELY QUESTION (THIS INTERVIEWER)	LP	ANGLE — WHAT TO EMPHASIZE	SKIP / NEVER SAY
Who was the customer and what changed for them?	Customer Obsession	The site got an enforceable standard; the carriers got a fair promise; the team got 8–10 hours a week back.	1–2 hrs/wk is the after, never the before.

S14 — Manhattan Associates — the $2.5M OMS↔WMS discrepancy my manager wanted to fix quietly: transparency as the reconciliation control, two days before an executive review

LPs this story can serve here: Earn Trust (primary — the flagship integrity story) · Have Backbone, Disagree & Commit (backup — refusing the quiet fix) · Ownership (the seam between OMS and WMS) · Bias for Action (third — two days to the review) · Customer Obsession (the customer told first and given the priority)
Process family: Deliver / Return-to-book — order-to-fulfillment reconciliation control; incident handling under a customer-relationship deadline

Honesty label. The census, the risk argument, the customer pack and the war room were mine; the consultants traced the handshake, wrote and verified the per-line patch, and built the permanent fix. The $10M initiative is never counted as savings. Manhattan is the era in which I personally configured Manhattan DOM — the only platform configuration claim in canon.

60-SECOND BUSINESS-FIRST PITCH — STOP ON THE PRIMARY METRIC

Situation. Two days before an executive review at a Manhattan Associates retail customer, the order-management and warehouse-management systems did not reconcile — about two hundred orders, $2.5 million of order value — and a $10 million initiative rode on that review. My manager and the room favored a quiet back-end correction: a cross-table script, written in under two days, and nobody tells the customer. **Task.** I was the consultant who would run whichever path was chosen; I owned the recommendation and then the war room. **Action.** Facts before path: I built the discrepancy census by cause on a sample of the two hundred orders — which handshake step, which order states — and named the fear of losing the initiative as legitimate. Then I disagreed on risk, not principle: a script across related tables written in two days cannot be verified; an IT audit would turn a data issue into a reputation issue on a $10M relationship; the expected corruption from the silent path was about $1.5M of risk. I offered to run the war room personally so the cost of my position landed on me. He accepted, hesitantly. The customer got root cause, plan and timeline before the review — no apology-first — prioritized their own orders, asked for a per-line, reversible patch on that set with before-and-after evidence per order, and gave time for a clean fix to the handshake. **Result.** Primary metric: the OMS–WMS discrepancy — about 200 orders and $2.5M → zero on the customer's prioritized set before the review, then zero through the permanent fix; a standing reason-coded reconciliation report read before every executive review from then on. The $10M initiative was won — a record fact about the relationship that I never count as savings. Lesson: silent corrections are loans against trust at a terrible interest rate.

SITUATION / TASK — THE BUSINESS PROCESS PROBLEM, SCOPE, SCALE, BASELINES

S — Two days before an executive review, OMS and WMS didn't reconcile — ~200 orders / $2.5M — and a $10M initiative rode on the review. My manager and the room favored a quiet back-end correction.

The risks of the quiet path: a rushed cross-table script corrupting data (the record's own illustration: expected ≈$1.5M of corruption), a near-certain audit finding turning a data issue into a reputation issue on a $10M relationship, and the customer surprised at the review. The customer in this story is the retailer's executives and the IT and finance teams who would otherwise find out from an audit.

T — I was the consultant who would run whichever path was chosen; I owned the recommendation and then the war room. Goal: the discrepancy to zero and a review the relationship could survive, without a silent correction.

Baselines on the table: OMS↔WMS discrepancy ~200 orders / $2.5M (target zero with before/after evidence per order) · new discrepancies unmonitored (target zero on a standing daily report) · two days to the review.

ACTION — THE PROCESS / OPERATING-MODEL REDESIGN, IN GATED PHASES

- **Discovery (day 1, morning)** — discrepancy census by cause (handshake step × order state) on a sample of the ~200; exposure statement (review in two days; $10M initiative); both options named honestly. *Exit bar:* the room agrees the facts before the path; the fear of losing the initiative named as legitimate.
- **Plan & Design (day 1, afternoon)** — options memo on risk, not principle: a two-day cross-table script is error-prone; an IT audit turns a data issue into a reputation issue; transparency = root cause + action plan + I run the war room. *Exit bar:* manager accepts, hesitantly; my labor attached to my position.
- **Build & Test (day 2)** — customer communication pack (root cause, plan, timeline — no apology-first); war-room plan (bridge, log, cadence); verification method for any patch (per line, reversible, before/after recorded). *Exit bar:* customer briefed before the review; war room staffed.
- **Cutover (review + patch)** — took the customer's prioritized order list; ran the bulk patch per line with verification; scheduled the clean root-cause fix. *Exit bar:* patch verified; discrepancy to zero on prioritized orders; review held with the facts on the table.
- **Hypercare / Close** — the permanent OMS–WMS handshake fix; the reason-coded reconciliation report as a standing control read before every executive review. *Exit bar:* $10M initiative won; handshake reconciles; new discrepancies = 0 on the daily report.

Influence and ownership. Mine: the census, the risk argument, the customer pack and the war room; the consultants traced the handshake, wrote and verified the per-line patch, and built the permanent fix. The argument was about risk, not virtue, and my labor was attached to my position. Had my manager said no, I would have documented the risk assessment in writing and asked for the decision recorded with its owner — disagree and commit, with the tripwire (any audit query on those orders) named; I would not have run the silent script without that record.

> **Designed the process; others own it now.** I designed the customer pack, the war room and the verification method; the standing reason-coded reconciliation is read before every executive review by the account team, not by me.
> **Trade-off put to leadership.** The recommendation to my manager outlined the competing metrics — two days of speed with a cross-table script vs the risk of an error-prone patch and a reputation issue — and attached my own labor to the transparent path.

RESULTS — $ · # · % · TIME · CUSTOMER · QUALITY (CANON NUMBERS ONLY)

- **$** — ~200 orders / $2.5M discrepancy → zero (record); the $10M initiative won — a record fact about the relationship, never counted as savings; ≈$0.1M/yr *modeled* from the standing reconciliation (range $55–160K); the ≈$1.5M expected corruption from the silent script is *avoided risk*, not a saving.
- **#** — ~200 orders patched per line, reversible, with before/after evidence per order, in the customer's priority order (record).
- **Time** — two days to the executive review; the customer briefed before the review, not in it; the clean root-cause fix scheduled after (record).
- **Customer** — the customer prioritized their own orders, asked for the bulk patch on that list, and gave time for a clean fix — the review held with the facts already on the table (record).
- **Quality** — per-line reversibility — no bulk script across related tables; the standing reason-coded OMS↔WMS reconciliation read before every executive review; new discrepancies = 0 on the daily report (record).
- **%** — no percentage claim exists in the record for this story — say the counts and the control; do not invent a rate.

L6 LEVEL EVIDENCE — what the interviewer pattern-matches against the Amazon L6 functional rubric; every line is this story's canon, no new numbers

L6 DIMENSION	EVIDENCE IN THIS STORY
Ambiguity	Two days to an executive review, a $10M initiative at stake, and a manager's preferred quiet fix. I ran the discrepancy census by cause (handshake step × order state) and named both options honestly before choosing the path.
Scope & influence	My manager persuaded on risk, not virtue; the customer's executives briefed before the review; the consultants traced the handshake and built the patch and the permanent fix — influence one level up and outward to the customer.
Execution trade-off + mechanism others now own	A two-day cross-table script (speed) vs a per-line reversible patch plus transparency (risk) — the recommendation was framed as risk, and my labor was attached to my position. Mechanism others own now: the reason-coded OMS↔WMS reconciliation read before every executive review.
Impact (long-term)	~200 orders / $2.5M discrepancy → zero; the $10M initiative won (a record fact about the relationship, never counted as savings); new discrepancies = 0 on the daily report.
Process improvement (standard work institutionalized)	The verification method for any patch (per line, reversible, before/after recorded); the war-room plan (bridge, log, cadence); the standing reconciliation as a control, not a project.
Complexity & consensus	The fear of losing the initiative named in the room; the customer prioritized their own orders and gave time for a clean fix — the review held with the facts already on the table.
Root cause at scale	The census by handshake step × order state led to a permanent OMS–WMS handshake fix, not just the patched orders — the trending cause removed.

PROBING — CHALLENGE Q&A TUNED TO THIS INTERVIEWER

BR — You're claiming the $10M?

No. The initiative was won in the review the facts survived; I claim the control and the posture, not the contract value. The only recurring dollar I model is ≈$0.1M a year from the standing reconciliation, labeled; the ≈$1.5M is the record's illustration of expected loss from the silent script — avoided risk, not money earned.

BR — Your manager wanted the quiet fix. What exactly did you say, and what if he had said no?

Privately first, with the census. I disagreed on risk, not principle: an unverifiable script plus an audit exposure versus a customer told the truth with a plan — and I offered to run the war room so the cost landed on me. He accepted, hesitantly. Had he said no, I would have documented the risk assessment in writing and asked for the decision recorded with its owner, with the tripwire named; I would not have run the silent script without that record.

BR — Why not just apologize and fix it?

No apology-first. The customer pack was root cause, action plan and timeline — to their IT and finance before the executive review, not in it. They responded by prioritizing their own orders and giving us time for a clean fix; an apology without a plan would have given them nothing to decide.

BR — What control outlived the war room?

The reason-coded OMS↔WMS reconciliation as a standing check, read before every executive review rather than two days before one — status mapping, timing, failed message, manual edit; a row with no class is an investigation, not a bucket. The handshake fix removed the cause; the report made sure the next one surfaced early.

BR — A hundred thousand a year is small for a flagship story.

Yes, and I would rather say small and true. The story is about the control and the choice, not the run-rate. The hardest input is how many discrepancies arise per month; I assumed the two hundred built over about sixty days. I would read the daily match report's reason-code counts for a quarter and price exactly what surfaced.

> **BR — Anything more recent where you disagreed upward?**
>
> Yes — re-sequencing my manager's roadmap at Flexport on cost-to-serve evidence (the hiring manager heard that one), and at Sephora the rule I had written myself and had to correct through the same three signatories. Same posture: disagree on evidence, carry the consequence.

THE KEY MATH — THE DISCREPANCY, THE TWO PATHS PRICED, AND THE STANDING CONTROL (RECORD PAIRS; PROBABILITIES ILLUSTRATIVE)

STEP	QUANTITY	FORMULA → SUBSTITUTION	BASIS	VALUE
1	The discrepancy	`$2,500,000 / 200 = $12,500 average per order`	record pair; average derived	~200 orders, ≈$12.5K each
2	Quiet path priced	`blast = 2 × $2.5M = $5.0M; E[loss] = 0.3 × $5.0M = $1.5M + a near-certain audit finding`	P(error) 0.3 and 2× blast radius illustrative	≈$1.5M avoided risk — not a saving
3	Honest path priced	`a few days' delay on a customer-controlled subset of $2.5M`	record argument	bounded, one-time
4	Patch	`per line, reversible; evidence rows = set size; customer's priority order first`	record	0 on the set before the review
5	Standing control	`match rate = orders with OMS status == map(WMS status) / orders in flight; Σ 4 reason classes = all of Δ`	record design	exposure at detection ~$2.5M/60 d → ~1 day
6	Recurring value	`manual fixes ≈$30K + stuck cash ≈$30K + war rooms ≈$40K ≈ $0.1M`	modeled; range $55–160K	≈$0.1M/yr modeled
7	$10M initiative	`won — excluded from any savings column by rule`	record fact about the relationship	never claimed

Where this lands at Amazon. The purest Earn Trust pattern — tell the customer first, price the honest path's cost onto yourself, and leave a standing control so the courage is rarely needed again. The transferable control is not the courage; it is the reason-coded reconciliation read before every review. Reliability (a seam that reconciles daily), responsiveness (the customer decided the priority), trust that survives an audit.

TWIST MAP — LIKELY LP QUESTIONS FROM THIS INTERVIEWER → THE ANGLE TO TAKE WITH S14

LIKELY QUESTION (THIS INTERVIEWER)	LP	ANGLE — WHAT TO EMPHASIZE	SKIP / NEVER SAY
Tell me about a time you had to deliver bad news to a customer.	Earn Trust / Customer Obsession	Root cause, plan, timeline before the review; the customer set the priority; no apology-first.	Never count the $10M as impact.
Tell me about a time you disagreed with your manager.	Have Backbone, Disagree & Commit	On risk, not principle; war room offered; the "what if he had said no" answer ready — document, record the owner, name the tripwire.	Do not make the manager the villain — his fear was legitimate and named as such.
Tell me about acting fast under a deadline.	Bias for Action	Two days: census by cause in a morning, options memo in an afternoon, customer pack on day two, per-line patch before the review.	Do not imply the permanent fix was done in two days — it was scheduled after.
Tell me about owning a problem across system boundaries.	Ownership	The seam between OMS and WMS had no owner; the census, the patch method and the standing report gave it one.	Consultants built the patch and the fix — say so.

LIKELY QUESTION (THIS INTERVIEWER)	LP	ANGLE — WHAT TO EMPHASIZE	SKIP / NEVER SAY
How do you design a reconciliation control?	Functional — control design	Reason-coded classes that sum to the delta; a row with no class is an investigation; read before every review, not two days before one.	No invented percentage — the record has none here.
Why did this matter beyond the one customer?	Broad Responsibility	A silent fix would have taught the practice that quiet scripts are acceptable; the standing control and the posture became the practice's norm.	Do not claim practice-wide dollars — none exist.

Question bank — likely questions for this interviewer, with a one-line answer plan

Bar-raiser questions: LP-depth probes, mid-story LP switches, softest-number challenges and the consistency check. Each plan points at a packet story; stories allocated to other interviewers are pointers only.

#	LIKELY QUESTION	ANSWER PLAN (ONE LINE)	STORY
1	**Tell me about a time you earned trust the hard way.**	S14 pitch — tell the customer first; cost priced onto me; the standing control; $10M won, never claimed.	S14
2	**Tell me about a mistake you made and what changed because of it.**	S16 — the security review; two weeks; owned upward the same day; zero Mondays skipped; the kickoff question.	S16
3	**Tell me about developing someone.**	S15 — the QA lead who authored and defended the gate; development measured by whether the gate survived my leaving.	S15
4	**Tell me about a time the data disagreed with everyone.**	S10 — three years in SQL; true DQ ~55%; measurement, not carriers; Finance-signed method before the number.	S10
5	**Switch LP mid-story: "OK — now tell me that same story as Frugality / Customer Obsession / Bias for Action."**	Keep the facts identical; change emphasis per the twist map (e.g., S16 as Frugality = the >$100K priced; S14 as Bias for Action = the two days; S10 as Customer Obsession = the carriers could not dispute).	Twist maps
6	**Which of your numbers would you least want me to check?**	Name the softest input in the story just told and how to firm it (S16 decision risk; S15 criticals base count; S10 the $0.5M analyst capacity; S14 discrepancies per month) — never defend a soft number as record.	All four
7	**What did you give up for the customer?**	S14 — my time in a war room and the risk of being wrong in front of them; S15 — the stories I covered so dev could drop them; S10 — weeks of schedule for evidence.	S14 / S15 / S10
8	**What is your biggest weakness as a leader?**	I convert verbal agreements into documents people must sign — slower in the week; and I under-planned a dependency with a lead time once (S16) and now over-ask that question at every kickoff.	S16
9	**Tell me about a time you had to scale something.**	S10 — Austria → 25 sites at a rules file plus one DQ cycle each; the super-user model; the method signed before the number so scale could not inflate the claim.	S10
10	**How do you decide what not to build?**	S16 — ship with the cross-reference table, push the real key upstream; S15 — the drop-date rule; S14 — no bulk script across related tables.	S16 / S15 / S14
11	**Why should we hire you over someone who has run an Amazon network region?**	Fifteen years designing the supply chain — definitions, lead times, buffers, one truth — and keeping it honest in a weekly review; I have not run an Amazon region and won't pretend otherwise; the pattern transfers, the scale is the reason I am here.	Master TMAY close
12	**Is there anything you've told the other interviewers that you'd state differently to me?**	No — and name the two numbers most likely to be cross-checked: 7 → 68 is 9.7×, and the two $2.5M figures (Manhattan discrepancy; Sephora headline) are different things.	Consistency box

Cheat-numbers box — canon values with basis labels

Canon numbers for S16, S15, S10 and S14 with their basis labels, plus the cross-loop figures a bar raiser is most likely to cross-check — from the master packet's §4.1 ledger.

METRIC	VALUE TO SAY	BASIS	NEVER
S16 accuracy / bus factor	WBR data accuracy 60% → 90%; bus factor 1 → ≥2; parity within 1% for consecutive weeks; 4% ticket-sync drop caught	record	conflating with S11's ETA accuracy 60 → 90% without saying which
S16 dollars	>$100K/yr priced baseline in infra's own loaded rates; ≈$30K hours + ≈$70K decision risk (≈$50K retired) + ≈$15K bus factor	priced (record of the pricing) / modeled	"saved $100K"
S16 miss	data-access security review — 2 weeks lost; owned upward the same day; zero WBR deliveries skipped	record	"a dependency slipped"
S15 team / cadence	20-person Product/Eng/QA team; six-week hybrid → four-week agile in six weeks; releases 8.7 → 13	record / modeled (releases)	a direct-report headcount
S15 quality / dollars	critical defects per release −50%; ≈$0.13M/yr (≈$90K + ≈$40K; range $80–270K)	record / modeled	the four-per-release base count as record
S10 data quality	~55% true (40% reported) → ~99% in 3 months; ≈97% agreement auto vs manual sample; manual 8–10 → 1–2 hrs/wk	record	"99% in two months"; 1–2 hrs as the before
S10 dollars	$500K/yr Austria (10% of ~$5M, Finance-signed, executed-only) → ~$8M across 25 EU sites / 400+ lanes; ~$320K/site derived; ≈$0.5M/yr analyst capacity	record / record roll-up / modeled	"$1M routing guide"; counting negotiated-not-executed
S10 design	lane key (from, to, mode, volume band, Incoterm, SLA); Incoterm on ~8% of lanes; no-hit pages a human	record	site-wave counts or dates beyond "Austria first"
S14 discrepancy	~200 orders / $2.5M → 0 on the prioritized set before the review; per-line reversible patch with before/after evidence	record	a percentage — none exists
S14 initiative	$10M initiative won	record — never counted as savings	any realized dollar on it
S14 modeled	≈$0.1M/yr standing reconciliation (range $55–160K); ≈$1.5M expected corruption from the silent script	modeled / avoided risk	calling the $1.5M a saving
Cross-loop multiples	7 → 68 = 9.7× (S11, HM's story)	record	"10×" / "50×"
Cross-loop site count	"six sites" (Elementum)	record	"six NA sites"
Platform configuration	Manhattan DOM — the only platform personally configured	record	"I configured S/4" / BlueYonder / Locus / Snowflake

Never-say, one glance before the call.

- Never count the $10M initiative as savings; never claim the >$100K as savings; never call S14's ≈$1.5M a saving.
- Never "10×" or "50×" (9.7×); never "six NA sites"; never "$1.5M to $2M"; never "$1M routing guide"; never "99% in two months."
- Never invent a direct-report headcount, a days-to-tie figure, a percentage for S14, or site-wave counts for S10.
- Never let the two $2.5M figures blur (Manhattan discrepancy vs Sephora headline) — they belong to different interviewers' stories.
- Never "we" for an action that was mine; name the team's part once — consultants (S14), infra (S16), data platform team (S10), the QA lead (S15).
- S11/S12, S6/S8, S2/S18, S1/S3 are the other four interviewers' — pointers only; if the bar raiser has read their notes, connect (S16 ↔ S11; S14 ↔ S12 "more recent upward disagreement") without re-telling.

Backup bench — use only if a primary doesn't fit

Four fallbacks for the bar raiser, none of them another interviewer's primary, chosen to cover the LPs the four primaries leave thin: S19 (Elementum · Walmart-client — the promise buffer as one governed dial; Invent & Simplify / Frugality / Dive Deep, all model), S20 (Elementum · Walmart-client — the pre-purchase WBR and the Andon; Highest Standards / Earn Trust on mechanism design — keep separate from S11's production WBR), S13 (Manhattan — Cyber Monday at 4 AM; Bias for Action / Customer Obsession) and S9 (Elementum — 597 lanes two levels up; Backbone / Think Big — the Think Big gap in the LP grid). Tell S16, S15, S10 and S14 first; a bar raiser compares notes, so a bench story must carry exactly the master's numbers.

Bench discipline. The two (or four) primaries above are the stories to tell first. Reach for a bench story only when the question genuinely does not fit a primary, or when the interviewer asks for "another example" on an LP already spent. Each entry is a 60-second pitch, a compressed STAR, one results line and two probes — enough to answer and stop; no full probing bank or derivation. Where a bench story is another interviewer's primary, the red note says so: use it only if the question demands it, and keep the facts identical to that packet.

BACKUP — ONLY IF ASKED S19 — Elementum (client: Walmart Marketplace) — the delivery-promise buffer rebuilt as priced risk: one governed dial, +32 points of fast-promise share at the same 95% floor (all model, no record dollar)

LPs this backup can serve: Dive Deep (alternate when S8/S10 are spent) · Invent and Simplify (alternate) · Frugality (speed bought with zero new spend) — design-flavored probes

Basis. Engagement lead for the promise-policy workstream; the client's promise-engineering and data-science teams owned and built the engine and the transit models — I never configured or deployed any platform. Every quantity is from the engagement's illustrative twelve-cohort model — say "the model" in the same breath; there is no production dollar and none is ever promoted. Labels (metro two-day, mountain rural) are the model's illustrative cohort names.

60-SECOND PITCH — STOP ON THE PRIMARY METRIC

Situation. A marketplace client printing delivery dates on inventory it never touches: promised date = order time + seller handling + predicted transit + a safety buffer — and the buffer was a flat 1.10 days on every lane regardless of variability. In the engagement model — twelve lane cohorts, about a million orders a week, transit σ from 0.22 to 1.60 days — that flat buffer printed 95.8% accuracy but put only 7.6% of orders on a fast promise: dense metro lanes over-insured and fat-tailed rural lanes under-insured at the same time. **Task.** Own the decomposition, the alternatives, the validation gates and the governance recommendation; the client's data science and engineering did not report to me. **Action.** Discovery: the buffer-waste audit — the flat buffer bought $\Phi(5.0)$, near-certainty, on the tightest cohort and only $\Phi(0.69) \approx 75\%$ on the widest. Plan & Design: four policies on one comparison table — uniform, σ-proportional with one governed dial, minimum-days at the floor, profit-optimal on priced breach economics. Build & Test: $b = 1.645\sigma$ holds 95% on every cohort by construction; the equimarginal check proved the optimum; the Q4 drill showed a frozen summer dial breaking the floor. Cutover: four shadow weeks against logged live orders before any displayed promise. Hypercare: the dial published in the weekly review header, re-solved before peak. **Result.** Primary metric: fast-promise share 7.6% → 39.6%, +32 points at the held 95% floor; average promised day 3.09 → 2.75; +$255K a week, about $13.3M a year — all on the illustrative book, and I say "the model" in the same breath.

COMPRESSED STAR

- **S —** A flat 1.10-day buffer on every lane: 95.8% headline accuracy hiding over-insurance on tight lanes and under-insurance on loose ones; fast-promise share 7.6% (model).

- **T —** Lead the promise-policy workstream: decompose the waste, put priced alternatives on one table, design the gates, leave a governance instrument — not a tuning habit.
- **A —** Promise identity and accuracy factorization; buffer-waste audit; four policies on one table; proofs (Φ(1.645) = 0.95 per cohort, equimarginal check, Q4 drill at ~1.45× σ); shadow mode for four weeks; the dial k owned by a business owner and printed every Monday.
- **R —** Fast-promise share 7.6 → 39.6% (+32 pts) at exactly the 95% floor; average promised day 3.09 → 2.75; +$255K/wk ≈ $13.3M/yr — model, labeled; the widest cohorts got honestly slower promises (1.10 → 2.63 days) on purpose.

RESULTS LINE

Fast-promise share 7.6% → 39.6% (+32.0 points) at a held 95.0% floor (model) · average promised day 3.09 → 2.75 (model) · +$255K/wk ≈ $13.3M/yr vs uniform (modeled on the illustrative ~1M-order book) · the profit-optimal frontier (97.8% accuracy, ≈ +$20M/yr) handed to Finance as a priced decision — shown, never claimed, never merged with the $13.3M.

TWO PROBES

> **The whole story rests on an illustrative cohort set.**
>
> It does, deliberately — the model exists so the argument happens in numbers instead of adjectives. If the real σ looks nothing like the model's, k changes and the lane ranking changes; what survives any parameter set is the structure: buffers risk-proportional, the last buffer-day buying the same accuracy everywhere, and a floor that disagrees with the breach economics treated as a governance finding.

> **Why one dial instead of per-lane learned buffers?**
>
> Data science wanted per-lane learned buffers — more model, more value, invisible governance. I priced the difference and recommended the one-dial policy first: it captures most of the value, it is auditable, and σ improvements flow into speed automatically and visibly. The no went into the comparison table as a priced row, not a meeting minute.

Canon numbers (basis labels): 7.6% → 39.6% fast-promise share (+32 pts, model) · 95.8% → 95.0% accuracy held at the floor (model) · 3.09 → 2.75 promised days (model) · +$255K/wk ≈ $13.3M/yr (modeled) · 12 cohorts, ~1M orders/wk, σ 0.22–1.60 days, k = 1.645 (illustrative model) · breach ≈$12 vs margin ≈$6.50 (model assumptions). Never a production dollar.

BACKUP — ONLY IF ASKED S20 — Elementum (client: Walmart Marketplace) — the pre-purchase WBR: input levers under output metrics, the five-minute red-week decomposition, and the Andon that replaced a 30-day lag

LPs this backup can serve: Insist on the Highest Standards (alternate — hard reds on policy floors) · Earn Trust (alternate — mix-adjusted twins, honest denominators) · Dive Deep (alternate — the factor math) — cadence/mechanism probes

Basis. I designed the weekly business review — metric architecture, decomposition math, thresholds and control loop — and led the program that stood it up; the client's engineering built the pipelines and dashboards and their teams own the lines. I never configured or deployed any platform and never claim a production output metric moved. The production-record WBR story is S11 (Flexport) — keep the two separate.

60-SECOND PITCH — STOP ON THE PRIMARY METRIC

Situation. A marketplace client whose delivery promise was owned by a committee: data science owned the model, engineering the engine, seller ops the handling, carrier programs the lanes — and promise accuracy, the one number the customer feels, was owned by nobody between Tuesdays. Scorecards ran on 30-day rolling windows, so a degrading seller or carrier did weeks of customer damage before any floor bit, and a red week was a blame negotiation. **Task.** Design and stand up the weekly business review — outputs a customer feels, input levers a named owner can turn, and the math that connects them — plus a control loop faster than the 30-day clock. **Action.** Discovery: one glossary, one event source, audited denominators. Plan & Design: seven output metrics over ten input levers, each input with a roll-up and a named owner; the factorization — accuracy ≈ seller-ships-in-window × carrier-meets-transit × Φ(buffer/σ) — as the decomposition; red/green at ±5% relative week-over-week with hard reds on policy floors. Build & Test: the sample-week proof — 0.97 × 0.985 × 0.996 ≈ 95.2% — and the drill: a regional carrier miss (97% nationally, 82% in the Southeast) decomposed to its factor in minutes. Cutover: Monday data freeze, Tuesday review, reds pre-wired with cause, owner, date. Hypercare: mix-adjusted twins next to every raw output, and the Andon — a 7-day control chart per seller-lane cell, act within 24 hours. **Result.** Primary metric: red-week attribution — a blame negotiation → minutes, by factor math; detection-to-action 30 days → under 24 hours by design; one joint headline, Promise Yield = fast share × accuracy, 41.5% baseline on the docs' sample. The only dollar is modeled: about $580K per caught degradation episode, and I say "modeled" in the same breath.

COMPRESSED STAR

- **S —** Output metric owned by a committee; 30-day rolling windows smearing step changes into drift; three teams keeping three clocks; a red week discovered live and negotiated.
- **T —** Design the WBR for the pre-purchase delivery experience and lead the program that stood it up — then hand it to owners and leave.
- **A —** One glossary and denominator audit; 7 outputs over 10 input levers with roll-ups and named owners; the factor identity as the decomposition; ±5% WoW red/green with hard reds on floors; Monday freeze → Tuesday review, reds pre-wired; mix-adjusted twins; a cell-grain Andon (7-day EWMA/CUSUM, 2× baseline breach, n ≥ 30, act in 24 h, false-trip bar < 5%).
- **R —** Attribution days → minutes; detection-to-action ~30 days → < 24 h (designed); Promise Yield 43.6% × 95.2% ≈ 41.5% baseline on the docs' sample, four-quarter design target 50%; ≈$0.58M per caught episode (modeled).

RESULTS LINE

Red-week attribution: a cross-team negotiation → minutes by factor math (proven on the sample-data drill) · detection-to-action ~30 days → under 24 hours by design (the Andon) · 7 outputs / 10 inputs / 1 joint headline / 6 sample weeks (engagement design record) · ≈$0.58M per caught degradation episode (modeled; no annual figure — episode frequency is the client's data and I won't invent it).

TWO PROBES

> **Your baseline Promise Yield is sample data.**
>
> Correct, and I say so: 43.6% × 95.2% ≈ 41.5% is the engagement docs' own illustrative six-week set, used to prove the mechanics before live lines existed. The 50% target is a target on the real book, and the first live job is re-baselining it.

> **How is this different from the Flexport review (S11)?**
>
> S11 is the production record — a review I ran by hand every Monday for over a year with record numbers (automation 40 → 90%, accuracy 60 → 90%). This engagement is where the review's mathematics — the factor decomposition and the control loop — was carried furthest as a design for a client. I keep the two separate and never borrow a number across them.

Canon numbers (basis labels): 7 outputs / 10 input levers / 1 joint headline (design record) · 0.97 × 0.985 × 0.996 ≈ 95.2% (sample-week proof) · 97% national vs 82% Southeast (engagement's worked example) · 30 days → < 24 h (designed) · Promise Yield 41.5% baseline, 50% target (docs' sample) · ≈$0.58M per caught episode (modeled: ≈$192K/wk × 3 weeks). Never a production output claim.

BACKUP — ONLY IF ASKED S13 — Manhattan — Cyber Monday, 4 AM: allocation across 3 DCs and 100 stores when the scheduler died

LPs this backup can serve: Bias for Action (primary) · Customer Obsession (primary backup — the promise ranked first) · Deliver Results

Basis. OMS consultant on allocation, promising and the OMS–WMS handshake; engineering fixed the scheduler once I isolated it; the post-mortem mechanisms were mine to drive. $8M / $6M / 99% are record; the margin figures are my model at benchmark rates. Older story — if asked for recent, pair with the UDC robotics throttle (S2): same muscle, 2024–25.

60-SECOND PITCH — STOP ON THE PRIMARY METRIC

Situation. Manhattan OMS consultant on allocation and promising across 3 DCs and 100 stores; 4 AM Cyber Monday the VP called — backorders piling with inventory present, ~$6M of sales at risk against a 95% fill-rate goal. **Task.** Own the response before the root cause was known. **Action.** Discovery: the contradiction (ATP > 0, backorders rising) was the entry bar to declare an incident. Plan & Design: I ranked by promise-at-risk, not FIFO; node choice = the promise — near 0.85 days vs far 4.60. Build & Test: one bridge, every rebalance timestamped; reason-coded alerts I had already built. Cutover: rebalanced so no DC drowned; status every two hours until 9 PM. Hypercare: root cause — the allocation scheduler died silently at the daylight-saving change; the post-mortem shipped a heartbeat, a DST checklist, a 3σ page rule and a rehearsed rebalance playbook. Lesson: decide reversibly, log it, find the cause later. **Result.** Primary metric: peak fill rate — 95% goal → 99% delivered. ~$8M of peak sales protected against ~$6M at risk (record); my model puts that at ≈$3.2M of gross margin at a 40% benchmark margin; structural stockouts −20% over the engagement.

COMPRESSED STAR

- **S —** 4 AM Cyber Monday: backorder lines piling with inventory present; promises aging; ~$6M at risk against a 95% fill goal; nobody had written a clearing rule for failure.
- **T —** Own the response before the cause was known, without making it worse.
- **A —** Declared the incident on the contradiction; clearing rule — promise-at-risk, not FIFO — written on the bridge log in the first hour so nobody re-argued it at noon; rebalanced across three DCs; two-hourly status; isolated the DST scheduler death through my own reason-coded alerts; blameless post-mortem → heartbeat, DST checklist, 3σ page rule, rehearsed playbook.
- **R —** Fill 99% vs the 95% goal; ~$8M protected vs ~$6M at risk (record pair); structural stockouts −20% over the engagement; the next peak ran boring.

RESULTS LINE

Peak fill 99% vs the 95% goal (record) · ~$8M of peak sales protected vs ~$6M at risk (record pair — one-time sales that didn't die, never a saving) · ≈$3.2M gross margin at a 40% benchmark (modeled) · structural stockouts −20% over the engagement (record) · detection moved from a VP phone call to one heartbeat interval.

TWO PROBES

Why act before you knew the cause?

Because waiting had an hourly price — the queue was aging while inventory sat idle — and a reversible, logged intervention did not. I checked with engineering first that manual clears could not corrupt allocation, timestamped every rebalance, and hunted the cause in parallel with alerts I had already built.

> **Isn't this a hero story?**
> The event is; the post-mortem is the point. Carrying the first stretch solo is one of my do-differentlys. What I would present as the result is the mechanism set — heartbeat, DST checklist, 3σ page rule, rehearsed playbook — and that the next peak ran boring.

Canon numbers (basis labels): 99% fill vs 95% goal (record) · ~$8M protected vs ~$6M at risk (record) · 3 DCs / 100 stores (record) · near 0.85 d vs far 4.60 d (record) · −20% structural stockouts (record) · ≈$3.2M margin at 40% (modeled). Never "$2MM baseline"; never present $8M as a saving.

BACKUP — ONLY IF ASKED S9 — Elementum — 1,000 supplier/carrier routes asked, 597 built first: X12 EDI onboarding behind a ≥95% valid-ASN cohort gate

LPs this backup can serve: Have Backbone; Disagree & Commit (primary — 597 vs 1,000, two levels up) · Deliver Results · Insist on the Highest Standards (the gate held twice) · Think Big (the staged 1,000-lane vision) · Broad Responsibility (small carriers kept inside the standard by the portal floor)

Basis. I owned the scope analysis and the onboarding standard, influencing an executive two levels above my sponsor; engineers built the maps and harness to the standard; Transportation owned the carrier relationships. Cohort sizes and the number of cohorts are not in the record — do not quote them.

60-SECOND PITCH — STOP ON THE PRIMARY METRIC

Situation. The Global Head of Supply Chain wanted inbound visibility on 1,000 lanes in two months; shipment-data completeness was 60% and high-value lanes were blind. **Task.** I owned the scope analysis and the onboarding standard, influencing an executive two levels above my sponsor. **Action.** Discovery: a spend Pareto — 597 lanes carried 80% of freight spend — pre-validated with Transportation and Procurement before I took it up. Plan & Design: the onboarding standard (X12 850/855/856/940/945/214/997 with an XML/portal floor — "the standard was the data, not the transport") and a cohort gate of ≥95% valid ASN. Build & Test: a mapping-and-test harness and a scorecard per lane. Cutover: 597 live in month one; one cohort failed the gate twice on a timestamp format and I held it both times. Hypercare: completeness scorecards to 95%; ~200 lanes the next wave behind the same gate. Lesson: automating dirty data manufactures confident wrong answers — the gate is the product. **Result.** Primary metric: inbound shipment-data completeness 60% → 95%. Freight spend −10% ≈ $2M in six months (record); 597 lanes = 80% of spend live in month one; adoption 8×.

COMPRESSED STAR

- **S —** 1,000 global lanes asked in two months — scope, schedule and quality all fixed; completeness 60%; lanes differed by orders of magnitude in spend and carriers differed in EDI capability.
- **T —** Own the scope analysis and the onboarding standard; take the re-scope two levels up with the evidence attached.
- **A —** Spend Pareto (597 = 80% of spend) pre-validated so no lane owner could contradict it in the room; standard + ≥95% valid-ASN gate published to carriers before cohort one; harness so later cohorts were mostly configuration; held a failing cohort twice; ~400 lanes carrying ~20% of spend deferred — priced in spend share, not lane count.
- **R —** Completeness 60 → 95%; 100% visibility on high-value lanes; 597 lanes live month one; freight −10% ≈ $2M in six months (record); method written up as the sourcing SOP.

RESULTS LINE

Completeness 60% → 95% (record) · 597 of 1,000 lanes = 80% of freight spend live in month one (record) · freight spend −10% ≈ $2M in six months (record — kept as measured, never annualized) · adoption 8× (record) · ≈$0.4M/yr document-handling labor (modeled add-on).

TWO PROBES

You defied a Global Head of Supply Chain's number. How?

With the spend curve and the lane owners' validation attached — 597 lanes carried 80% of the spend, so the phased plan was argued in spend share, not lane count. He accepted the phasing off the curve; I then committed to the remainder behind the same gate and delivered it.

> **Is the $2M annualized?**
>
> No — it is the record as measured: minus ten percent on the onboarded lanes' spend in six months. My three-way split (routing-guide compliance ~$0.8M, mode discipline ~$0.6M, expedites and detention ~$0.6M) decomposes the record; it never adds to it.

Canon numbers (basis labels): 60% → 95% completeness (record) · 597 / 1,000 lanes = 80% of spend (record) · −10% ≈ $2M in 6 months (record) · ≥95% valid-ASN gate, held twice (record) · 8× adoption (record) · ≈$0.4M/yr labor (modeled). Never: cohort counts or sizes; never double the $2M into a run-rate.
